Managely Release Notes

November 2026

Version 5.3.77.17

Application Corrections

Unable to add note to work order in Sedona-X

Searching the notes on a work order, customer, site, or system could fail when at least one note in the list had no text. A single empty note caused the search to return an error for the entire list of notes, even though opening the list of notes worked correctly. This issue affected Managely Sedona-X Mobile users.

This release corrects the problem. Notes with no text are now skipped during a search instead of causing an error, so searching a list of notes works even when the list contains an empty note. The same correction applies to the other text search options, such as "does not contain," "starts with," "ends with," "equals," and "does not equal." Previously, an empty value could also cause errors with those options when the list was searched this way.

Notes behave the same as before in every other way.
